Disclosures

- Funding
 - U.S. National Institute of Mental Health (1R01MH102202-01A1); PI: Dr. Wilson, Ira
- Conflicts
 - No conflicts of interest

Background

- Clinical benefits associated with adherence to antiretroviral therapies (ARTs) for HIV

- Reduce viral load
- Improve quality of life
- Delay progression to AIDS
- Reduce mortality risk

Holkmann et al. HIV Med 2007; Kousignian et al. Clin Infect Dis. 2008; DART Trial Team. AIDS 2008; EI-Sadr et al. N Engl J Med. 2006.

- Half of HIV patients discontinued ART within 2 years

Gonzalez-Serna et al. J Antimicrob Chemother 2014.

- Very few studies examine re-initiation of ART

- Focused on African populations
- Small sample size
- Poorly defined measures for re-initiation of ART

Toulson et al. The J of Infectious Diseases. 2005; Teklu et al. BMC Health Services Research. 2017. Lewis et al. J AIDS. 2010

Study Questions

- How many ART discontinuers re-initiate therapy within 18-months?
- Which patient characteristics are associated with ART re-initiation?
- Does greater engagement in care lead to higher re-initiation of ART?

Methods: Medicaid Program

- Joint federal-state income-based public health insurance program
- Enrollment criteria vary by state
 - Income qualifications
- Claims for some enrolled populations not observable
 - Managed care enrollees
 - Medicare-Medicaid duals

Methods: Design and Data Sources

- Retrospective cohort study of Medicaid fee-for-service (FFS) patients
- The Medicaid Analytic eXtract (MAX) files:
 - 14 states with 75% of HIV prevalence in the U.S.
 - Longitudinal years: 2001-2012

CDC. HIV surveillance report, 2010; vol. 22. Atlanta

Methods: Study Population

- Medicaid beneficiaries who stopped an ART regimen
 - ART regimen: drugs from 2+ ART drug classes for ≥ 30 days
 - ART stopping date: last prescription fill + 90 days' gap

Methods: Primary Analysis

**Index: ART
stopping date**

**Follow-up end:
End of 18 months**

6-month baseline

Patient characteristics:

- Demographics: age, sex, race and state
- Health services utilization: hospitalization, outpatient visits
- Comorbidity status
- Baseline ART persistence (time to discontinuation, continuous variable)
- Index year

Outcome:

Whether an ART regimen was restarted or not by end of 18 months

Analyses:

Multivariable logistic regression

Methods: Sensitivity Analysis

- Follow-up end to the earliest event:
 - ART re-started (study outcome)
 - End of 18 months N=110,338
 - Death
 - Medicaid FFS discontinuation
 - Medicaid MCO enrollment/dual status
 - Multistate status

- Analysis: multivariable Cox proportional hazards regression

Results: Overall Baseline Characteristics

Baseline characteristics	Study cohort (n=30,384)
Age	
Mean (SD), years	42.3 (9.2)
<45 years	60.5%
Females	47.8%
Race	
Black, not Hispanic	55.1%
White, not Hispanic	18.7%
Hispanic or Latino	17.2%
Presence of hospitalization	25.2%
Outpatient visits	
0	12.1%
1-2	8.2%
≥3	79.7%
Presence of non-HIV-related comorbidities	13.8%
Presence of HIV-related comorbidities	5.6%

Results: 18-month ART Re-start Rate

ART re-start status following discontinuation	Count, n (%)
Did not re-start ART	17,412 (57.3)
Re-started within 6 months	3,640 (12.0)
Re-started between month 7-12	6,907 (22.7)
Re-started between month 13-18	2,425 (8.0)
Total	30,384 (100)

Results: Logistic Regression

Patient characteristics at baseline

Demographics

Age: <45 vs. ≥45 years

Females vs. Males

Comorbidities

HIV-related

1.11 (1.01 - 1.22)

HIV-unrelated

1.00 (0.94 - 1.07)

Persistence, 1 mon. increase

1.07 (1.06 - 1.09)

Note: Model adjusted for state

Less likely to re-start an ART

More likely to re-start an ART

Limitations

- No laboratory data e.g., CD4+ cell counts and viral loads
- Prescription claims
 - Filled prescription \neq medication taken
 - Alternative sources of medications (samples, free supplies)
- Unmeasured confounders
 - e.g., substance use status, education
- Generalizability
 - Medicaid versus Medicare, commercially insured, and uninsured HIV patients
- Lack of follow-up after Medicaid disenrollment

Conclusions

- Only 42.7% of HIV patients using ART re-start therapy following 90-day discontinuation
- Patients with greater engagement in healthcare (outpatient visits) were more likely to re-start their ART regimen (adjOR 2.02)
- Females were less likely to re-start their ART regimen (adjOR 0.87)
- Differences in Medicaid eligibility and benefits across states are expected to influence ART re-initiation

Implications

- Efforts to improve patients' engagement in care should lead to better ART use
- Efforts for younger, female patients should be prioritized

Thank you! Questions?
