BRITISH COLUMBIA
CENTRE *for* EXCELLENCE
in HIV/AIDS

Phylogenetic clustering

- ▶ A popular method for characterizing the transmission history of an epidemic.
- ▶ HIV evolution and transmission unfold on similar time scales.
- ▶ Clusters of genetically similar infections can represent localized outbreaks of HIV transmission.

HIV treatment in BC, Canada

- ▶ BC Centre for Excellence in HIV/AIDS is responsible for all routine HIV drug resistance genotyping in the province.
- ▶ HIV genotyping is automatically performed on all new patients' baseline samples submitted for viral load testing.
- ▶ Data are already available from ~75% of the 11,000 people ever enrolled in Drug Treatment Program (DTP)*.
- ▶ All de-identified sequences deposited in DTP database with anonymous clinical, demographic, and risk factor data.

* Estimated HIV prevalence in BC: ~15,000 persons

HIV treatment in BC, Canada

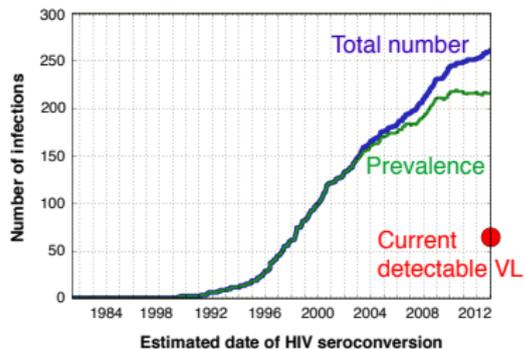

- ▶ BC Centre for Excellence in HIV/AIDS is responsible for all routine HIV drug resistance genotyping in the province.
- ▶ HIV genotyping is automatically performed on all new patients' baseline samples submitted for viral load testing.
- ▶ Data are already available from $\sim 75\%$ of the 11,000 people ever enrolled in Drug Treatment Program (DTP)*.
- ▶ All de-identified sequences deposited in DTP database with anonymous clinical, demographic, and risk factor data.

*Estimated HIV prevalence in BC: $\sim 15,000$ persons

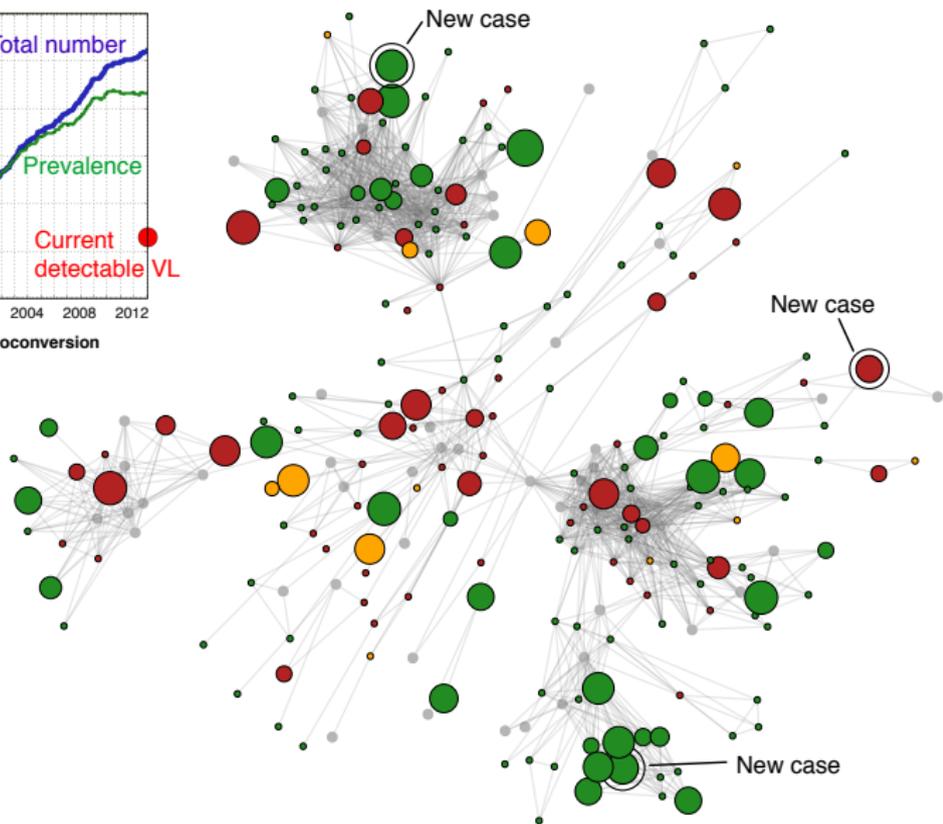

BC Centre monitoring system

- ▶ Automated system queries the drug resistance database hourly.
- ▶ If new records exist, it performs a phylogenetic analysis of entire database and maps clusters.
- ▶ Determines if new cases appear within clusters, defined at a minimum size of 5 individuals.
- ▶ Monthly and quarterly reports[†] on cluster growth and characteristics issued to Centre directors, BC Centre for Disease Control, BC Ministry of Health.

[†]Daily reports to lab director.

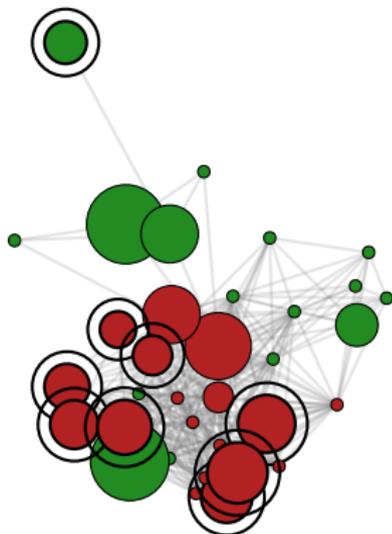

- Transmitted drug resistance
- Intermediate resistance
- No resistance
- Deceased
- Undetectable viral load

An 'actionable' cluster

- ▶ Detected growth of a cluster by 9 new cases in 3 months.
- ▶ All but one carried transmitted HIV drug resistance[‡] (TDR).
- ▶ Prompted a formal outbreak investigation, currently ongoing.
- ▶ Majority of viral loads have since changed from high to undetectable.

[‡]K103N, NNRTI resistance

Concluding remarks

- ▶ Difficult to obtain timely information on recent changes in an epidemic.
- ▶ Real-time monitoring of population-wide resistance data can inform targeted HIV prevention efforts.
- ▶ Preserving treatment options by detecting and averting transmission of HIV drug resistance.
- ▶ Knowledge translation was driven by a recent local outbreak of transmitted drug resistance.

This work was supported by a CIHR operating grant awarded to Poon (HOP 111406), by NIH NIDA grants 1-R01-DA036307-01 (Montaner) R01-DA021525-06 (Wood) and R01-DA011591 (Kerr), and a grant from Genome Canada for Genomics and Personalized Health (Harrigan/Montaner).

I am supported by a Partner Scholar Award from the Michael Smith Foundation for Health Research / St. Paul's Hospital Foundation-Providence Health Care Research Institute; and a New Investigator Award from CIHR.

Ethical approval for this study was granted by the Providence Health Care / University of British Columbia Research Ethics Board (H07-02559).
